**Abstract.** in the process of globalization, we live in an information age when, as a result of the rapid development of computer technology, the flow of information is increasingly accelerating, exerting its influence on the thinking of all people on earth. Information is the whole set of information about the world around us, about all kinds of processes occurring in it that can be perceived by living organisms, electronic machines and other information systems. This is how we perceive the concept of “information” in the modern world. This article is devoted to the problem of threats in the information flow.

**Keywords:** *information, information attack, information struggle, mass culture, information process, strategic goal, negative information.*

The process of assimilation of information and its processing is the essence and content of personality development. Information systems characteristic of the manifestation of human consciousness are implemented on the basis of interaction and changes. The formation and accumulation of objects in the information system indicates their development. Consequently, images of objects that cannot influence other information systems cannot exchange places with the information space in other systems, since they do not have any perceptual ability. Therefore, an undeveloped information exchange system may lose its position and face a crisis. This property is inherent in such information structures as consciousness, personality, worldview, social consciousness, as well as any information system [5].

Human development can be considered as a process and result of mutual information interactions. The selectivity of information in overcoming the disorder that arises in a person's life, in his structure and formation, is important not only for his life, but also for the formation of needs for the same information. The development of information technologies, considered as an important stage in the development of mankind, the emergence of new forms of information exchange has led to the dissemination of a large amount of information [3]. It was from this period that specialists began to use the concepts of “information attack”, “information struggle”, “mass culture”.

In the XXI century, the struggle for new reserves and wealth has acquired a whole new form. Now neither weapons nor large troops are required to conquer any state. Rather, it is enough to poison the minds of the inhabitants of this state, to instill ideas alien to their mentality and national values.

The information process is a tragedy in its own sense with its negative sides, in addition to the positive ones. In the process of development, each information is implemented with a strong strategic goal [2]. For this reason, negative information disseminated via the Internet is one of the global problems of today. Based on these considerations, given that the population of Uzbekistan makes up a significant weight of the population of Central Asia, the level of information and psychological security of the individual in our country also affects the stability of the Central Asian region as an integral geographical region. It can be said that a global security system arises only if it is secured at the national and regional levels. Thus, based on the interests of Uzbekistan, in-depth psychological and sociological studies are conducted in our country, which are of great practical importance in the field of “information and psychological security of the individual”.

It should be noted that due to the high demand for information in the XXI century, a person receives a variety of information that he needs. However, the belief in the impartiality or truthfulness of information disseminated via the Internet is an urgent problem [1]. In particular, it is well known that some messages on the Internet encourage subversive actions. For this reason, the whole world is concerned that such methods of information dissemination are used by various destructive organizations. It requires knowledge of the motives of political processes, as well as the essence of the issues of political education of the individual, the formation

and development of immunity to information attacks and active influence on them. Therefore, our state pays great attention to the orientation of political and social activity of young people, the formation of their political, legal, ideological consciousness.

The attention paid to youth in our country, the conditions created, the rapidly implemented reforms in this area focused on human education contribute to the formation of a harmonious generation, the education of young people who have an independent opinion, are able to freely express their opinions, resist large-scale, alien ideas, make their worthy contribution to strengthening Uzbekistan among the developed countries of the world [4].

The problem of identifying the intellectual abilities and opportunities of young people, their spiritual improvement, harmonization of personal and social interests in work, teaching awareness of the needs of the development of the Motherland, effective work, increasing social activity sets our society the task of implementing important measures in this area. In a word, one of the main goals and objectives envisaged by the reforms in all spheres carried out today under the leadership of our President is the upbringing of a spiritually and morally educated, independent, strong-willed personality, which is the future of society. There is no doubt that such individuals responsibly and selflessly serve, first of all, the Motherland, the conscious interests of society and contribute to its prosperity.
